

## Elements, compounds and mixtures

- Element – are shown in the periodic table
- Compound – two or more elements chemically bonded
- Mixture – two or more elements or compounds not chemically bonded
- Mixtures can be separated by physical processes – filtration, crystallization, distillation, chromatography

## Atomic models

- Plum pudding model – negative electrons embedded throughout the atom, rest of atom is positive
- Nuclear model – most of the mass of an atom in the nucleus, most of the atom is empty space

## Structure of the atom

Subatomic particle	Mass	Charge	Position in the atom
Proton	1	+1	Nucleus
Neutron	1	0	Nucleus
Electron	Very small	-1	Electron shells

- Atomic number – number of protons in an atom
- Atomic mass – number of protons + neutrons added together
- Electrons fill the shells 2,8,8
- Isotopes are atoms of the same element with a different number of neutrons

## Periodic table

- Mendeleev left gaps and predicted existence of new elements

## Group 1 – Alkali metals

- More reactive going down the group
- Single outer electron feels less electrostatic attraction from the nucleus as we go down the group
- Alkali metal + water  $\rightarrow$  metal hydroxide + hydrogen
- All have 1 electron in the outer shell

## Group 7 – The halogens

- More reactive at the top of the group
- Further down the group the outer electron shell feels less attractive force from the nucleus due to electron shielding
- All have 7 electrons in the outer shell

## Group 0 – Noble gases

- Full outer shell
- Don't react with anything

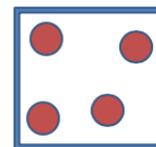

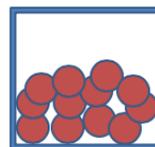

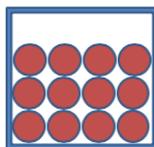

## Topic 1

# Atomic structure and the periodic table

## States of matter and state symbols

- Solid (s)
- Liquid (l)
- Gas (g)
- Aqueous (aq)

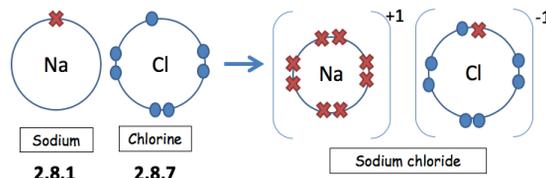

## Ions

- Atoms or groups of atoms that have lost or gained one or more electrons
- Metal atoms form positive ions
- Non-metal atoms form negative ions

## Ionic bonding

- Between metal and non-metal
- The metal atom transfers electrons to the non-metal atom
- Positive and negative ions attract
- Strong electrostatic force holds the ions together

## Ionic compounds

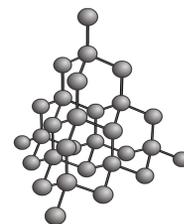

- Ions arranged in layers in a giant lattice structure
- Requires a lot of energy to break the bond so ionic compounds have a high melting and boiling point
- Cannot conduct electricity when solid as the ions cannot move
- Can conduct electricity when molten or dissolved as the ions can move

## Covalent bonding

- Between non-metals
- The atoms share a pair of electrons to get a full outer shell

## Simple covalent molecules

- Made of only a few atoms
- Weak forces between molecules means low boiling and melting points
- Examples – H<sub>2</sub>O, CO<sub>2</sub>, O<sub>2</sub>, CH<sub>4</sub>

## Giant covalent structures

- Made of billions of atoms
- Diamond, graphite, silica
- Strong covalent bonds between atoms means they have a high melting and boiling point
- Graphite has free electrons that can move so can conduct electricity

## Metallic bonding

- Metals
- Atoms arranged in layers
- Delocalised electrons can move so metals can conduct electricity and heat
- Atoms in a pure metal arranged in layers so the metal can be bent and shaped
- Alloys are stronger – atoms not in layers

## Law of conservation of mass

- Mass of products = mass of reactants

## Relative formula mass

- The sum of the relative atomic masses of the atoms shown in the formula
- Example –  $\text{H}_2\text{O}$      $\text{H} = 1$     $\text{H} = 1$     $\text{O} = 16$     Add them up = 18

## Moles (Higher only)

- Mass of one mole of a substance in grams is equal to its relative formula mass

$$\text{number of moles of substance} = \frac{\text{mass of substance (g)}}{A_r \text{ or } M_r}$$

## Concentration

$$\text{Concentration of solution} = \frac{\text{mass of solute (g)}}{\text{volume of solution (dm}^3\text{)}}$$

- To convert  $\text{cm}^3$  into  $\text{dm}^3$  you divide by 1000

## Extraction of metals

- Unreactive metals like gold are found unreacted in the ground
- Metals less reactive than carbon can be extracted from their oxides by reduction with carbon
- Metals more reactive than carbon can be extracted by electrolysis
- OILRIG – oxidation is the loss of electrons, reduction is the gain of electrons

## Neutralisation

- Acid + alkali  $\rightarrow$  salt + water
- Bases are insoluble metal hydroxides and metal oxides
- Alkalis are soluble metal hydroxides
- All acids contain  $H^+$  ions
- All alkalis contain hydroxide ions  $OH^-$
- $H^+ + OH^- \rightarrow H_2O$

## Strong and weak acids (Higher only)

- A strong acid is completely ionized in aqueous solution
- A weak acid is only partially ionized in aqueous solution
- As pH decreases by one, the  $H^+$  concentration in solution increases by a factor of 10

## Acid + metal

- Acid + metal  $\rightarrow$  salt + hydrogen
- Hydrogen gas test – lit splint makes a squeaky pop

## Acid + carbonates

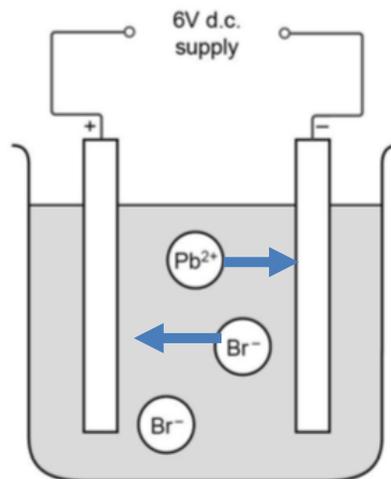

- Acid + metal carbonate  $\rightarrow$  salt + carbon dioxide + water
- Carbon dioxide test – limewater turns cloudy

## Making soluble salts

- Mix excess base with acid
- Add excess base to neutralize all of the acid
- Heat the solution to speed up the reaction
- Filter off the excess oxide
- Evaporate the water to leave crystals of salt

## Electrolysis

- Splitting a compound using electricity
- Solid ionic compounds cannot conduct electricity as there are no free ions
- Ionic compounds can conduct electricity when molten or dissolved as the ions can move
- Positive ions move to negative electrode (cathode)
- Negative ions move to positive electrode (anode)
- $Cu^{2+} + 2e \rightarrow Cu$
- $2Cl^- \rightarrow Cl_2 + 2e$

## Activation energy

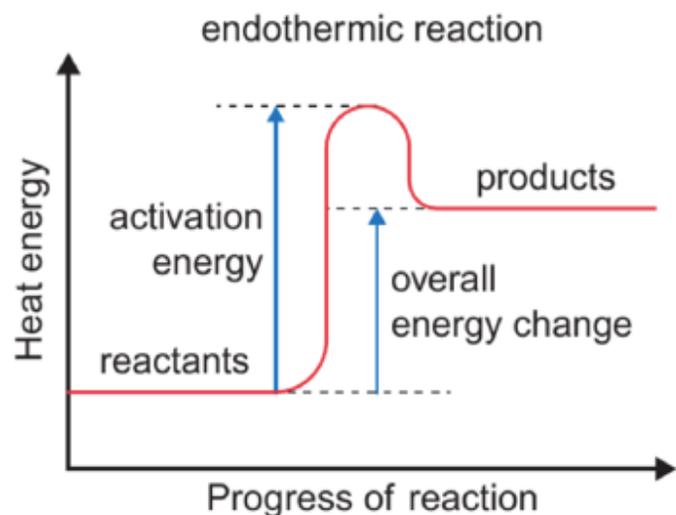

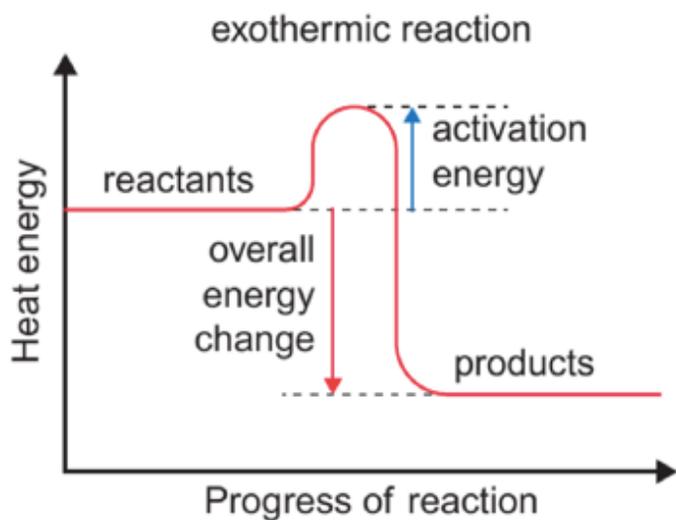

- The energy needed for a reaction to occur

## Exothermic reactions

- Transfers energy to the surroundings
- Temperature of the surroundings goes up
- Combustion and neutralization reactions are exothermic

## Endothermic reactions

- Takes in energy from the surroundings
- Temperature of the surroundings decreases
- Thermal decompositions and photosynthesis are endothermic

## Collision theory

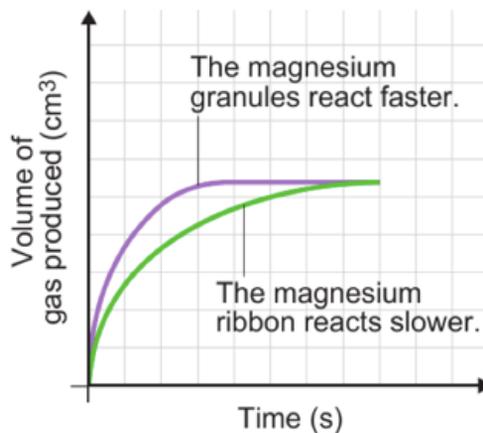

- Chemical reactions only occur when particles collide
- Particles have to collide with enough energy
- Minimum amount of energy needed for particles to react is the activation energy

## Factors affecting rate of reaction

- Increasing surface area increases rate of reaction – more collisions between particles
- Increasing temperature increases rate of reaction – particles move faster and collide more often
- Increasing concentration increases rate of reaction – there are more particles so more collisions

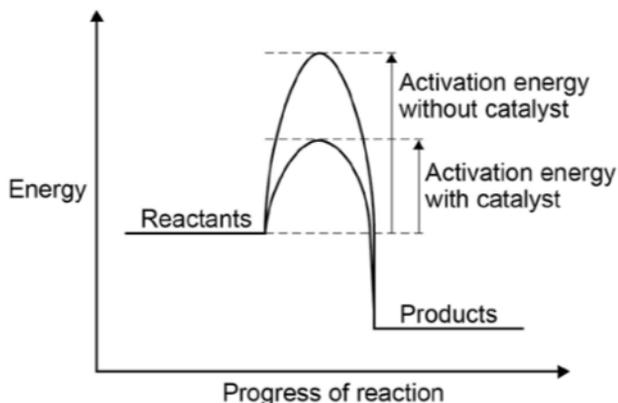

## Rate of reaction

- A steeper line shows a faster rate of reaction
- On this graph the blue line shows a faster rate

## Catalysts

- Catalysts speed up the rate of reaction but are not used up
- Catalysts increase the rate of reaction by lowering the activation energy
- A reaction profile for a catalyst is:

## Reversible reactions

- In some reactions, the products of the reaction can react to produce the original reactants

• Symbol for a reversible reaction:  $\rightleftharpoons$

## Equilibrium

- Equilibrium is reached when the forward and reverse reactions occur at exactly the same rate

## Crude oil

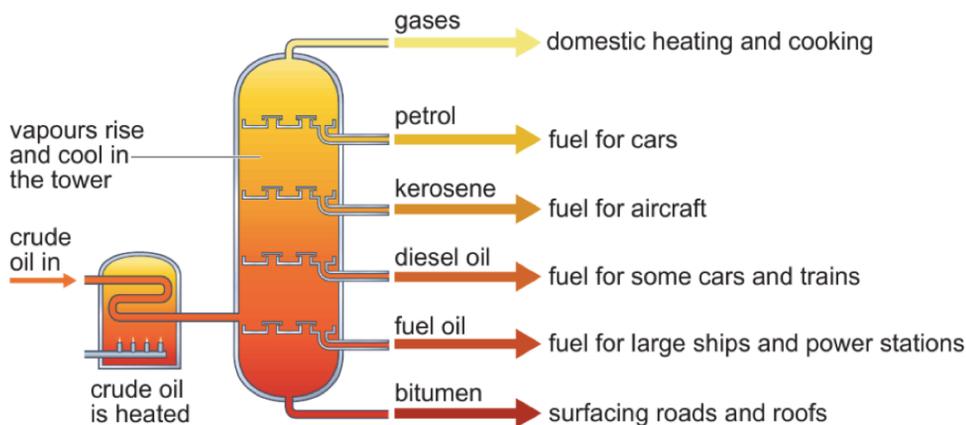

- Remains of plankton buried in mud under the sea
- A mixture of hydrocarbons

## Hydrocarbons

- Molecules made of hydrogen and carbon only

## Fractional distillation

- Crude oil is heated and evaporates
- Gases rise up a fractionating column and cool down and condense
- They condense at different points depending on the boiling point
- Most viscous at the bottom of the column
- Highest boiling point at the bottom of the column

## Alkanes

- Methane, ethane, propane, butane
- General formula  $C_nH_{2n+2}$
- React with oxygen to produce carbon dioxide and water

Name	Structural formula	Chemical formula
Methane	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{H} \\   \\ \text{H} \end{array}$	$\text{CH}_4$
Ethane	$\begin{array}{c} \text{H} & \text{H} \\   &   \\ \text{H}-\text{C} & -\text{C}-\text{H} \\   &   \\ \text{H} & \text{H} \end{array}$	$\text{C}_2\text{H}_6$
Propane	$\begin{array}{c} \text{H} & \text{H} & \text{H} \\   &   &   \\ \text{H}-\text{C} & -\text{C} & -\text{C}-\text{H} \\   &   &   \\ \text{H} & \text{H} & \text{H} \end{array}$	$\text{C}_3\text{H}_8$
Butane	$\begin{array}{c} \text{H} & \text{H} & \text{H} & \text{H} \\   &   &   &   \\ \text{H}-\text{C} & -\text{C} & -\text{C} & -\text{C}-\text{H} \\   &   &   &   \\ \text{H} & \text{H} & \text{H} & \text{H} \end{array}$	$\text{C}_4\text{H}_{10}$

## Cracking

- Cracking is breaking down longer hydrocarbons into smaller, more useful molecules
- A product of cracking is an alkene
- Test for alkenes: bromine water turns from orange to colourless

## Pure substances

- A single element or compound not mixed with any other substance
- Will melt at specific temperatures

## Formulations

- A mixture that has been designed as a useful product
- Formulations include fuels, cleaning agents, paints, medicines, alloys, fertilisers and foods

## Chromatography

- Used to separate mixtures
- Stationary phase – the chromatography paper
- Mobile phase – the solvent moving
- More soluble dyes move further up
- A pure compound will produce a single spot in all solvents

$$R_f = \frac{\text{distance moved by substance}}{\text{distance moved by solvent}}$$

## Test for hydrogen

- Lit splint
- Squeaky pop

## Test for oxygen

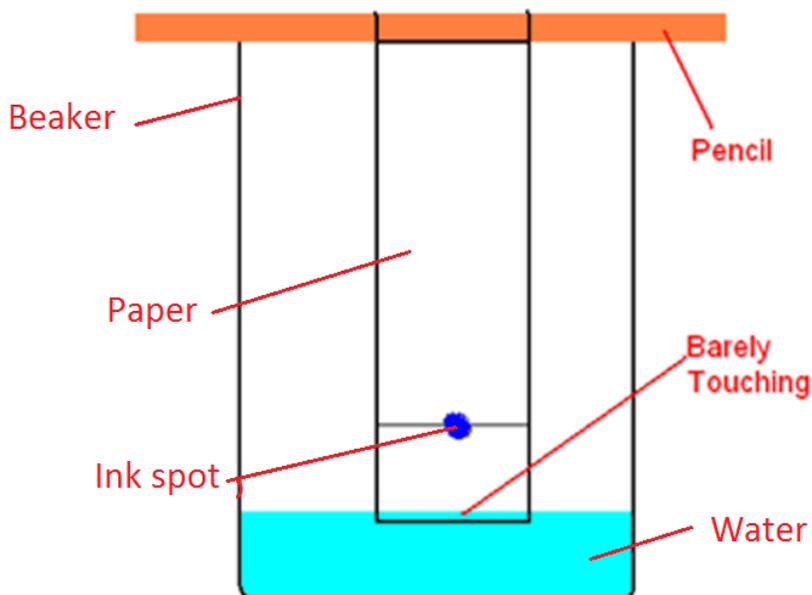

- Re-lights a glowing splint

## Test for carbon dioxide

- Bubble the gas through limewater
- Limewater turns cloudy

## Test for chlorine

- Damp litmus paper turns white

## The atmosphere today

- About 80% nitrogen
- About 20% oxygen
- Small proportions of carbon dioxide, water vapour and noble gases

## The early atmosphere

- Volcanoes released gases – water vapour, nitrogen, methane, ammonia, carbon dioxide
- No oxygen
- Water vapour condensed to form the oceans
- Carbon dioxide dissolved in the oceans

## How carbon dioxide decreased

- Dissolved in the oceans
- Formation of sedimentary rocks and fossil fuels
- Algae and plants used  $\text{CO}_2$  for photosynthesis

## How oxygen increased

- Algae and plants produced  $\text{O}_2$  by photosynthesis

## Greenhouse gases

- Maintain temperature on Earth to support life
- Water vapour, carbon dioxide and methane

## How human activities increase greenhouse gases

- Carbon dioxide – deforestation, burning fossil fuels
- Methane – farming

## Effects of climate change

- Sea levels rise
- More extreme weather
- Extinction of wildlife

## Carbon footprint

- The total amount of carbon dioxide and other greenhouse gases over the full life cycle of a product
- Can be reduced by reducing emissions of carbon dioxide and methane

## Atmospheric pollutants

- Combustion of fuels produces pollutants
- Carbon monoxide is a toxic gas
- Sulfur dioxide and oxides of nitrogen cause respiratory problems in humans and acid rain
- Soot particles cause health problems and global dimming

## Potable water

- Water that is safe to drink

## Desalination

- Making sea water or salty water safe to drink
- Can be done by distillation
- Requires large amounts of energy

## Waste water treatment

- Screening and grit removal
- Sedimentation
- Anaerobic digestion of sewage sludge
- Aerobic biological treatment of effluent

## Methods of extracting metals (Higher only)

- Phytomining – uses plants to absorb metal compounds from the ground. Plants then burnt to produce ash that contains metal compounds
- Bioleaching – uses bacteria to produce solutions with metal compounds

## Life cycle assessment stages

- Extracting and processing raw materials
- Manufacturing and packaging
- Use and operation
- Disposal

## Reusing and recycling

- Obtaining raw materials from the Earth by quarrying and mining causes environmental impacts
- Glass bottles can be crushed and melted to make different glass products
- Metals can be recycled by melting

Advantages of recycling	Disadvantages of recycling
<ul style="list-style-type: none"><li>• Conserves finite oil resources</li><li>• Saves energy</li><li>• Reduces need for mining</li><li>• Reduces waste disposed of in landfill</li><li>• Less pollution</li><li>• Cheaper to recycle than mine new ores</li></ul>	<ul style="list-style-type: none"><li>• Costs of collecting, sorting and melting metals</li><li>• Some metals more expensive to recycle</li></ul>

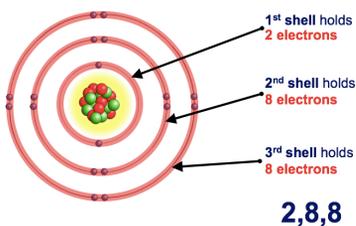

## Elements, compounds and mixtures

- Element – \_\_\_\_\_
- Compound – \_\_\_\_\_
- Mixture – \_\_\_\_\_
- Mixtures can be separated by \_\_\_\_\_

## Atomic models

- Plum pudding model – \_\_\_\_\_
- Nuclear model – \_\_\_\_\_

## Structure of the atom

Subatomic particle	Mass	Charge	Position in the atom
